Mathematics

Session 1 (Calculator)

You may use a calculator during this session.

25. Rochelle is finding the distance between points A and B on opposite shores of Pine River. She used a transit to create the right triangles and then measured the distances that are shown on the diagram below.

- Prove that triangles ABC and DEC are similar.
- Find the distance across the river between points A and B . Justify your answer mathematically, showing all of your work.

Scoring Guide

Score	Description
4	4 points
3	3 points
2	2 points
1	1 point OR Student demonstrates minimal understanding of the problem.
0	Response is incorrect or contains some correct work that is irrelevant to the skill or concept being measured.
Blank	No response.

Scoring information:

Part a: 2 points complete proof that triangles are similar
OR

1 point apparently correct reasoning, expressed vaguely and/or with significant error(s) in terminology (e.g., using the term or symbol for similarity when congruence is intended, or calling vertical angles “opposite angles”)

Part b: 2 points correct answer, 165 feet, and a complete justification OR $3 \times 55 = 165$
OR

1 point correctly dealing with the proportion (or equal ratios) but with minor computational error OR for correct answer only (165) without work

Notes:

Part a: Complete proof includes the reason that angles ACB and ECD are congruent (vertical angles) and that angles A and D have the same measure. (The congruence of the right angles does not have to be explicitly stated, but must be implied.)

Sample computation for part b:

$$\frac{x}{75} = \frac{25}{55}. \text{ So } 55x = 75 \times 25. \quad x = 165.$$

It is sufficient for the student to notice that 75 is 3 times 25 and so AB must be 3 times 55, or by writing $3 \times 55 = 165$.

Score Point 4

Sample 1

a. $\angle BAC \cong \angle EDC$ because all right angles are \cong +
 $\angle ACB \cong \angle DCE$ because vertical \angle 's are \cong therefore $\angle ABC \cong \angle DEC$ because
 if 2 \angle 's of a Δ are \cong , then the 3rd \angle 's are \cong
 so $\Delta ABC \sim \Delta DEC$ because if all 3 \angle 's in a Δ are \cong to all 3 \angle 's of
 another Δ , then the Δ s are similar.

b. The corresponding sides of similar Δ 's are proportional

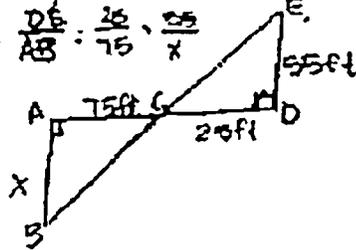

therefore $\frac{BC}{AC} = \frac{DE}{AB} = \frac{25}{75} = \frac{25}{x}$

$$25x = 75 \cdot 55$$

$$25x = 4125$$

$$x = \frac{4125}{25}$$

$$x = 165 \text{ ft}$$

The distance across the river
 (point A to B) is equal to 165 ft.

Score Point 3

Sample 1

a)

$\angle A \cong \angle D$
 $\angle ACB \cong \angle DCE$ by Vertical angle
 $\overline{AD} \perp \overline{ED}$ by perpendicularity Property
 $\angle B \cong \angle E$ by Sum of interior angles of a \triangle
 $\triangle ABC \cong \triangle CDE$ By Angle-Angle-Angle Similarity

b)

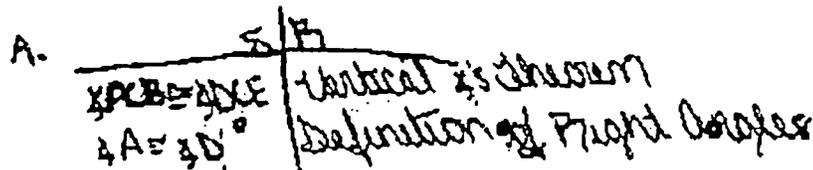

$\frac{55}{25} = \frac{x}{75}$

$\frac{4125}{25} = \frac{25x}{25}$
 $165 = x$

This is by the laws of Similar Figures

Score Point 2

Sample 1

They are similar because they share 2 \cong angles, and even though the sizes are different, they are similar.

B.

$\begin{array}{r} 25 \\ +55 \\ \hline 180 \end{array}$	$\begin{array}{r} 59 \\ +75 \\ \hline 4125 \end{array}$	$\begin{array}{r} 4125 \\ -1375 \\ \hline 2750 \end{array}$
--	---	---

$\begin{array}{r} 1375 \\ 2 \overline{) 2750} \\ \underline{2600} \\ 150 \\ \underline{150} \\ 0 \end{array}$

the distance between A & B is

(80 ft.)

Score Point 1

Sample 1

A	Statement	Reasons
	$\triangle ABC$ & $\triangle DCB$ are right	given
	$\triangle ABC \cong \triangle DCB$	Right Angles Theorem

B

$$75 \times 3 = 75$$
$$\frac{55 \cdot 3}{AB = 55}$$

Score Point 0

Sample 1

A. They both are right triangle.

B. 55 ft

Mathematics

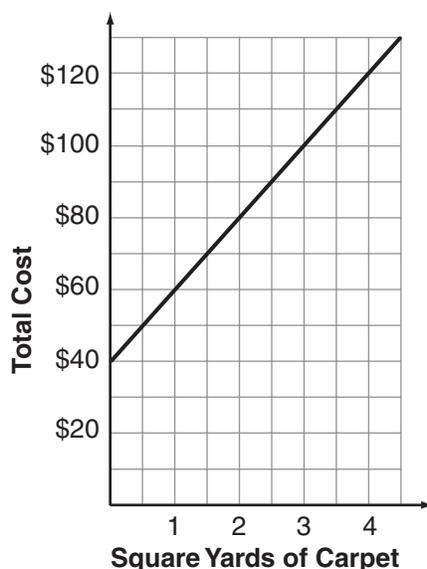

Session 3 (No Calculator)

You may **NOT** use a calculator during this session.

73. To install special carpet, the Home Store charges two fees:

- an initial preparation fee to prepare the floor for the carpet and
- a fee for each square yard of carpet that is installed.

The store's salespersons use the graph below to quickly determine the total cost of installing different numbers of square yards of this carpet.

- Write the equation for the line in the graph. Let y represent the total cost and x represent the number of square yards installed.
- Write the number that represents the y -intercept of the line on the graph.
- Write the number that represents the slope of the line.
- Suppose that the store decides to increase the cost per yard of the carpet but not to change the preparation fee. Explain how this change will affect **both** the y -intercept and the slope of the line.
- Suppose that the cost per yard is not changed but the preparation fee is increased. Explain how this change will affect **both** the y -intercept and the slope of the line.

BE SURE TO LABEL YOUR RESPONSES (a), (b), (c), (d), AND (e).

Scoring Guide

Score	Description
4	5 points
3	4 or 4½ points
2	1½ – 3½ points
1	½ or 1 point OR Student shows minimal understanding of writing equations, intercepts, and/or slopes.
0	Response is incorrect or contains some correct work that is irrelevant to the skill or concept being measured.
Blank	No response.

Scoring information:

Part a: 1 point for the correct equation, $y = 20x + 40$ or equivalent

Part b: 1 point for correct y -intercept, 40, or for the y -intercept based on the student's equation

Part c: 1 point for correct slope, 20, or for the slope based on student's equation

OR
½ point for giving slope as 2/2 or 1

Part d: 1 point for explaining that the slope will increase and the y -intercept will not change

OR
½ point for explaining that the slope will increase
or
that the y -intercept will not change

Part e: 1 point for explaining that the y -intercept will increase and the slope will not change

OR
½ point for explaining that the y -intercept will increase
or
that the slope will not change

Notes: If student's equation in part a uses different variables than y and x , do not award a 4-score, but do not otherwise penalize the student.

Score Point 4

Sample 1

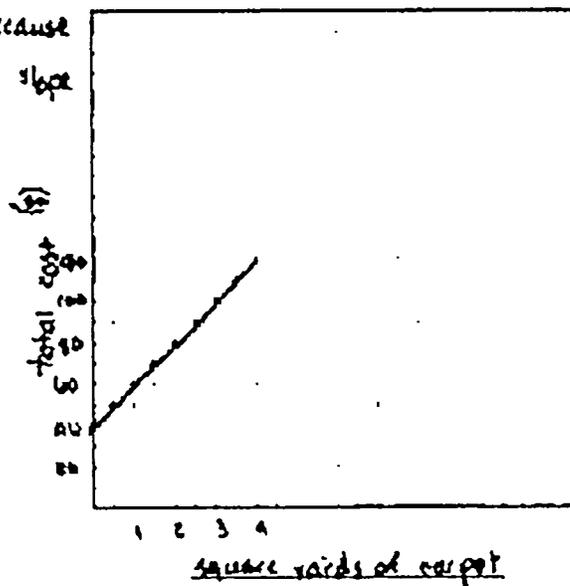

a) $y = 40 + 20x$

b) \$40 is the y-intercept

c) the slope of the line is for every square yard, it is \$20 more.
so the slope = 20.

d) The y-intercept will not change because the preparation fee is the same, but the slope will increase because the cost per yard is increasing.

e) The y-intercept will change because the fee is increasing, but the slope will remain the same.

Score Point 3

Sample 1

a. $y = 40 + 20x$

b. 40

c. $(0, 40)$ $(1, 60)$

$$m = \frac{60 - 40}{1 - 0}$$
$$= \frac{20}{1}$$
$$= 20$$

d. the y-intercept will start a little higher on the y-axis and the slope will increase way more

e. the y-intercept will start higher on the y-axis and the slope will gradually rise

Score Point 2

Sample 1

$$\begin{aligned} \text{A.) } y &= mx + b \\ y &= 1x + b \\ 60 &= 1(1) + b \\ 60 &= b \\ \boxed{y &= 1x + 60} \end{aligned}$$

$$\text{B.) } 40$$

$$\text{C.) } 1$$

D) You could say all the #'s on the y-axis (20, 40, 60 etc.) will move down. Making larger prices fit on the graph.

E) You would have to add the difference to everything, total cost.

Score Point 1

Sample 1

a) $y = 85x$

b) $2\frac{1}{2}$

c) $\frac{2}{2}$

d) It will affect it b/c all of the costs will go up and
b/c the square yards will be messed up also.

e) It will just affect the
total cost but not the
square yards.

A) ~~\$40 - \$20 = \$80.00.~~

B) 4

C) $2\frac{1}{2}$

D) Because the price will go up.

~~C~~) Because the higher the price is the slope will get less steeper.
